### **What is PsyD Research?**

There is a paucity of research that addresses the question, “What is Psy.D. research?” The National Council of Schools of Professional Psychology’s (NCSPP) Mission Bay Conference in 1987 resolved that a specific core curriculum should exist in professional psychology, across six areas of competency (professional relationship, assessment, research, intervention, consultation and management). One of the six core competency areas is Research and Evaluation (the systematic mode of inquiry involving problem identification and the acquisition, organization, and interpretation of information pertaining to psychological phenomena).

Thierweiler and Stricker (1992) view the professional psychologist as a local clinical scientist who has been trained to develop ways to understand local phenomena by integrating theory and practice. Thus, the goals of psychology health service provider research training are to:

1. foster development of a basic understanding and respect for scientific bases of the discipline;
2. be knowledgeable of methodological issues designed to make students thoughtful consumers of scientific research ;
3. acquire basic skills in conducting research and be able to design and execute projects in professional and (in some cases) academic contexts with support from trained consultants (e.g., statisticians).
4. analyze and evaluate the data within the context of professional psychology

Thieweiler and Stricker (1992) also assert that research training in professional programs should be used to enhance critical thinking skills, particularly in observation, logic, and the generation of plausible inference. Optimally, training should help in the development of attitudes of respect for empirical support, openness and flexible thinking, a sense of professional knowledge, recognition of personal issues, and understanding of ethical considerations in scientific inquiry. Ultimately, the focus of empirical training in professional psychology is the ability to link theories to practice.

As of 1997, the standard training model in professional psychology included qualitative and quantitative research, data analysis, and design of a project associated with professional practice. Blass and Givner (2005) reviewed 72 PsyD programs and found significant variations in research requirements across the programs. The course content and number of courses dealing with research methodology and statistics and research seminars differed across programs. All 72 programs required a literature review, while the research project which was required by most programs was not well-defined.

At Ferkauf, the scope and definition of the Psy.D. research projects are delineated by each individual doctoral program. The final documents must reflect the goals delineated above. The final document may use the traditional dissertation format, though there are no chapters, or a qualitative research format, an N=1 case study, or a program evaluation format or other format agreed upon by faculty. The determination is made in collaboration between the student and her/his research advisor.

## **Research Requirements for the PsyD degree**

### **Procedural and Administrative requirements**

The administrative procedure whereby this requirement is completed consists of four steps:

- |  |  |
|--|--|
| 1. Upon Completion of Research Project I:                | Form-Psy.D. 01<br>signed by research advisor and<br>program director   |
| 2. Upon Approval of proposal for<br>Research Project II: | Form-Psy.D. 02<br>signed by research advisor and<br>program director   |
| 3. Upon Completion of Research<br>Project II             | Form-Psy.D. 03<br>signed by research advisor and<br>program director<br>Program Competency evaluation forms  |
| 4. After Passing of Oral Examination:                    | Registrar's Form D30<br>signed by research advisor and<br>two readers<br>Program Competency evaluation forms |

Note: **Copies of all forms are found on pages 27-30.** Make copies for your files. **It is the joint responsibility of the research advisor and student to see that these forms are appropriately signed and submitted to the Psychology Office, where it is recorded in the student's record and submitted to the Registrar to become part of the student's transcript.**

### **Ethical Principles of Psychologists**

In the development and completion of the research requirements, all students are required to be familiar with and conform to the ethical principles of psychologists as delineated by APA's *Ethical Principles of Psychologists and Code of Conduct (2002)*.

Chapter 8 of APA's *Ethical Principles of Psychologists and Code of Conduct (2002)* is reprinted below:

#### **8. RESEARCH AND PUBLICATION**

##### **8.01 Institutional Approval**

When institutional approval is required, psychologists provide accurate information about their research proposals and obtain approval prior to conducting the research. They conduct the research in accordance with the approved research protocol.

##### **8.02 Informed Consent to Research**

(a) When obtaining informed consent as required in Standard 3.10, Informed Consent, psychologists inform participants about (1) the purpose of the research, expected duration, and procedures; (2) their right to decline to participate and to withdraw from the research once participation has begun; (3) the foreseeable consequences of declining or withdrawing; (4) reasonably foreseeable factors that may be expected to

influence their willingness to participate such as potential risks, discomfort, or adverse effects; (5) any prospective research benefits; (6) limits of confidentiality; (7) incentives for participation; and (8) whom to contact for questions about the research and research participants' rights. They provide opportunity for the prospective participants to ask questions and receive answers. (See also Standards 8.03, Informed Consent for Recording Voices and Images in Research; 8.05, Dispensing With Informed Consent for Research; and 8.07, Deception in Research.)

(b) Psychologists conducting intervention research involving the use of experimental treatments clarify to participants at the outset of the research (1) the experimental nature of the treatment; (2) the services that will or will not be available to the control group(s) if appropriate; (3) the means by which assignment to treatment and control groups will be made; (4) available treatment alternatives if an individual does not wish to participate in the research or wishes to withdraw once a study has begun; and (5) compensation for or monetary costs of participating including, if appropriate, whether reimbursement from the participant or a third-party payor will be sought. (See also Standard 8.02a, Informed Consent to Research.)

#### 8.03 Informed Consent for Recording Voices and Images in Research

Psychologists obtain informed consent from research participants prior to recording their voices or images for data collection unless (1) the research consists solely of naturalistic observations in public places, and it is not anticipated that the recording will be used in a manner that could cause personal identification or harm, or (2) the research design includes deception, and consent for the use of the recording is obtained during debriefing. (See also Standard 8.07, Deception in Research.)

#### 8.04 Client/Patient, Student, and Subordinate Research Participants

(a) When psychologists conduct research with clients/patients, students, or subordinates as participants, psychologists take steps to protect the prospective participants from adverse consequences of declining or withdrawing from participation.

(b) When research participation is a course requirement or an opportunity for extra credit, the prospective participant is given the choice of equitable alternative activities.

#### 8.05 Dispensing With Informed Consent for Research

Psychologists may dispense with informed consent only (1) where research would not reasonably be assumed to create distress or harm and involves (a) the study of normal educational practices, curricula, or classroom management methods conducted in educational settings; (b) only anonymous questionnaires, naturalistic observations, or archival research for which disclosure of responses would not place participants at risk of criminal or civil liability or damage their financial standing, employability, or reputation, and confidentiality is protected; or (c) the study of factors related to job or organization effectiveness conducted in organizational settings for which there is no risk to participants' employability, and confidentiality is protected or (2) where otherwise permitted by law or federal or institutional regulations.

#### 8.06 Offering Inducements for Research Participation

(a) Psychologists make reasonable efforts to avoid offering excessive or inappropriate financial or other inducements for research participation when such inducements are likely to coerce participation.

(b) When offering professional services as an inducement for research participation, psychologists clarify the nature of the services, as well as the risks, obligations, and limitations. (See also Standard 6.05, Barter With Clients/Patients.)

#### 8.07 Deception in Research

(a) Psychologists do not conduct a study involving deception unless they have determined that the use of deceptive techniques is justified by the study's significant prospective scientific, educational, or applied value and that effective nondeceptive alternative procedures are not feasible.

(b) Psychologists do not deceive prospective participants about research that is reasonably expected to cause physical pain or severe emotional distress.

(c) Psychologists explain any deception that is an integral feature of the design and conduct of an experiment to participants as early as is feasible, preferably at the conclusion of their participation, but no later than at the conclusion of the data collection, and permit participants to withdraw their data. (See also Standard 8.08, Debriefing.)

#### 8.08 Debriefing

- (a) Psychologists provide a prompt opportunity for participants to obtain appropriate information about the nature, results, and conclusions of the research, and they take reasonable steps to correct any misconceptions that participants may have of which the psychologists are aware.
- (b) If scientific or humane values justify delaying or withholding this information, psychologists take reasonable measures to reduce the risk of harm.
- (c) When psychologists become aware that research procedures have harmed a participant, they take reasonable steps to minimize the harm.

#### 8.09 Humane Care and Use of Animals in Research

- (a) Psychologists acquire, care for, use, and dispose of animals in compliance with current federal, state, and local laws and regulations, and with professional standards.
- (b) Psychologists trained in research methods and experienced in the care of laboratory animals supervise all procedures involving animals and are responsible for ensuring appropriate consideration of their comfort, health, and humane treatment.
- (c) Psychologists ensure that all individuals under their supervision who are using animals have received instruction in research methods and in the care, maintenance, and handling of the species being used, to the extent appropriate to their role. (See also Standard 2.05, Delegation of Work to Others.)
- (d) Psychologists make reasonable efforts to minimize the discomfort, infection, illness, and pain of animal subjects.
- (e) Psychologists use a procedure subjecting animals to pain, stress, or privation only when an alternative procedure is unavailable and the goal is justified by its prospective scientific, educational, or applied value.
- (f) Psychologists perform surgical procedures under appropriate anesthesia and follow techniques to avoid infection and minimize pain during and after surgery.
- (g) When it is appropriate that an animal's life be terminated, psychologists proceed rapidly, with an effort to minimize pain and in accordance with accepted procedures.

#### 8.10 Reporting Research Results

- (a) Psychologists do not fabricate data. (See also Standard 5.01a, Avoidance of False or Deceptive Statements.)
- (b) If psychologists discover significant errors in their published data, they take reasonable steps to correct such errors in a correction, retraction, erratum, or other appropriate publication means.

#### 8.11 Plagiarism

Psychologists do not present portions of another's work or data as their own, even if the other work or data source is cited occasionally.

#### 8.12 Publication Credit

- (a) Psychologists take responsibility and credit, including authorship credit, only for work they have actually performed or to which they have substantially contributed. (See also Standard 8.12b, Publication Credit.)
- (b) Principal authorship and other publication credits accurately reflect the relative scientific or professional contributions of the individuals involved, regardless of their relative status. Mere possession of an institutional position, such as department chair, does not justify authorship credit. Minor contributions to the research or to the writing for publications are acknowledged appropriately, such as in footnotes or in an introductory statement.
- (c) Except under exceptional circumstances, a student is listed as principal author on any multiple-authored article that is substantially based on the student's doctoral dissertation. Faculty advisors discuss publication credit with students as early as feasible and throughout the research and publication process as appropriate. (See also Standard 8.12b, Publication Credit.) **PLEASE SEE MODIFICATION OF THIS STANDARD ON PAGE 9 OF THIS DOCUMENT.**

#### 8.13 Duplicate Publication of Data

Psychologists do not publish, as original data, data that have been previously published. This does not preclude republishing data when they are accompanied by proper acknowledgment.

#### 8.14 Sharing Research Data for Verification

(a) After research results are published, psychologists do not withhold the data on which their conclusions are based from other competent professionals who seek to verify the substantive claims through reanalysis and who intend to use such data only for that purpose, provided that the confidentiality of the participants can be protected and unless legal rights concerning proprietary data preclude their release. This does not preclude psychologists from requiring that such individuals or groups be responsible for costs associated with the provision of such information.

(b) Psychologists who request data from other psychologists to verify the substantive claims through reanalysis may use shared data only for the declared purpose. Requesting psychologists obtain prior written agreement for all other uses of the data.

#### 8.15 Reviewers

Psychologists who review material submitted for presentation, publication, grant, or research proposal review respect the confidentiality of and the proprietary rights in such information of those who submitted it.

Request copies of the APA's Ethical Principles of Psychologists and Code of Conduct from the APA Order Department, 750 First Street, NE, Washington, DC 20002-4242, or phone (202) 336-5510.

**More than 200 hard copies of students' RP-I and RP-II's are available for review in the TA Office (Room 117). In addition, all RPIIs from the prior ten years are on CDs in the Psychology Office and may be borrowed for review.**

## The Research Curriculum

a. If a student wishes to conduct a quantitative research study, they are required to complete the following sequence of courses:

1. Statistics (3 credits)
2. Research Methods (3 credits)
3. Research Project I (3 credits)
4. Research Project II (3 credits)
5. Research Labs I-II (with Research Advisor)

b. If a student wishes to conduct a qualitative research study, they are required to complete the following sequence of courses:

1. Statistics (3 credits)
2. Research Methods (3 credits)
3. Qualitative Research (3 credits)
4. Research Project I (3 credits)
5. Research Project II (3 credits)
6. Research Labs I-II (with Research Advisor)

## Matching Faculty and Students

A faculty-student matching process takes place near the end of the first year's spring semester. This is the process:

- Faculty present their research interests to first year students at a colloquium or scheduled meeting. The goal of this meeting is to provide students with information about faculty's research so they may be able to make an informed decision about their research options.
- No students will be informally or formally matched with a faculty research advisor in advance of the official designated matching time.
- After faculty presentations, students submit a ranked list of 3-5 potential research topics to the Program Director with a brief rationale of their interests.
- Faculty will receive updated CVs for students who ranked them in advance of the faculty meeting.
- Faculty will have the opportunity, if they desire, to meet with students who ranked them 1, 2 or 3 to discuss mutual research interests (either in small groups – depending on the number of interested students – or in individual meetings). These meetings should take place after the spring semester ends or in September.
- The number of students a faculty member is currently mentoring will be considered in assignments.
- Students are then informed of the matching results and the first meeting between student and faculty takes place.

**Research Labs.** Students will register for the Research Lab affiliated with their Research Advisor in each semester they are affiliated with the lab. Research Labs carry zero credit per semester.

### **Research Project I**

The faculty member, designated as the Research Advisor, will eventually be the Principal Investigator for RPII. The purpose of the next series of meetings between the student and advisor is to clarify a research topic and begin outlining Research Project I.

The student registers for Research Project I (PSS 6915) in the spring semester of their second year and continues to register for the same course until it has been completed (see attached forms). Research Project I provides independent mentoring with a faculty advisor and culminates in a document that represents a state of the art review of a well-defined topic. After RPI has been approved the student registers for RPII.

### **Proposal for RPII**

It is at this point that the student will develop a proposal for Research Project II.

The proposal for RPII needs to be approved by the research advisor and submitted to AECOM's IRB for review and comment (See Form Psy.D. 02) through IRIS. When submitting your proposal to IRB your research advisor will be designated as the Principal Investigator for the study. The AECOM IRB must approve the proposal before beginning RPII.

### **Institutional Review Board**

The IRB office is located in Room 1002 of the Belfer Building. The telephone number is: 718-430-2237

The **Institutional Review Board** is the federally designated Institutional Review Board for all of the colleges of Yeshiva University, Albert Einstein College of Medicine, Jacobi Medical Center and North Central Bronx Hospital. As such, the IRB and its administrative staff, review all proposals for human subject research and monitor such research in compliance with all applicable federal and state regulations.

All “key personnel” engaged in a research protocol are required to complete the **CITI Tutorial program**. “Key personnel” is anyone who meaningfully contributes to the protocol development, implementation or data analysis, distributes surveys, conducts the informed consent process, conducts interviews, etc. *(In other words, every student and faculty member conducting any research at Ferkauf must complete the CITI tutorial prior to the initiation of any aspect of the research.)* The CITI tutorial is an educational package on ethical principles and processes concerning research with human subjects.

### **CITI Training and IRIS Process**

#### 1. Complete CITI Training

- a. Go to <https://www.einstein.yu.edu/administration/institutional-review-board/education/human-subjects.aspx>
- b. Follow the set of instructions that are appropriate for you
  - i. Individuals taking CITI for the first time
  - ii. Individuals refreshing for CITI completion (For individuals who last completed CITI 5 years ago.)
- c. Complete modules for SOCIAL & BEHAVIORAL RESEARCH
- d. There is a lot of information on this webpage so read it carefully. You want to complete the training course for social & behavioral research (the far right column)
- e. **VERY IMPORTANT:** Be sure to register using your YU email address.

2. After completing the CITI training, you will receive a certification of completion

3. Once you log in, you can contact IRIS at [iris-support@einstein.yu.edu](mailto:iris-support@einstein.yu.edu) to request for your username and password (will take 3-5 business days). In your email, send the following info:

- a. First Name
- b. Middle initial
- c. Last name
- d. Email address: tportal@mail.yu.edu (your YU email address)
- e. Employee Type: Student at Ferkauf Graduate School of Psychology (research assistant)
- f. Academic Department: Ferkauf Graduate School of Psychology

- g. Institution: Ferkauf Graduate School of Psychology.
- h. Were you ever an employee, faculty member, researcher, or in any way affiliated with YU, or one of its High schools or affiliated hospitals? NO
- i. ALSO, make sure to fill out and send the **Patient Information Confidentiality Agreement For All Employee And Medical Staff (attached)**

4. Log into IRIS account and activate your account

- a. Here is the link: <https://iris.einstein.yu.edu/>.

You will sign in with the username and password sent to you. Remember, they may be in 2 separate emails. Contact IRIS Support at 914-430-2776 to change your password.

**IRB forms and regulations**

All regulations and forms concerning IRB procedures and your responsibilities, as researchers, can be located and downloaded from

<http://www.einstein.yu.edu/administration/institutional-review-board/forms.aspx>

**Procedure.**

1. Complete all the required forms on line through the IRIS system
2. **You will note that your research advisor is to be designated as the Principal Investigator on all documentation.** You are the PI's delegate.
3. The proposal usually has four sections:
  - a. The Introduction should include a brief review of the literature, a statement of the problem and the hypotheses (5-10 pages).
  - b. The Methods section should include information on proposed number of participants, method of recruitment, and a tentative description of the sample. Review of the instruments – in terms of reliability, validity and appropriateness of the instrument for your sample.
  - c. The Design section should include information about design, definition of variables and control issues.
  - d. The Statistical Analysis and Design section provides information on the proposed analysis of the data. This does not need to be very comprehensive, although it should supply adequate information for evaluation and should be linked to the hypotheses. Depending on the type of research you conduct, you may also be required to conduct a power analysis.
4. Once your advisor approves the proposal, you need to submit it to the IRB using the IRIS system.
5. The document requires approval from your advisor, the Dean and Ferkauf designated faculty representative. All approvals are obtained electronically.

## Research Project II

Students register for Research Project II (PSS 6916) in the semester after completing RPI and **continue to register for this course, in future semesters, until all requirements – including the oral examination – have been completed.**

If the student completes the study at another facility under the supervision of a researcher connected to that site, that supervisor will be the designated Principal Investigator. The study's review will be completed under the auspices of that site's IRB. AECOM's IRB must also review the proposal. In addition, a full-time faculty member from your program will be designated as the co-PI and will be responsible for overseeing the research.

This paper is usually a product of the first project and may take the form of any one of a wide spectrum of possibilities including the following:

- a. An original quantitative or qualitative empirical study
- b. A replication of an empirical study
- c. Development or validation of an instrument
- d. Evaluation-outcome research (of a program or intervention)
- e. A case study or N=1 research
- f. Meta analysis
- g. Needs assessment

Since this research project is part of the curriculum for the professional degree, it is anticipated that the student will focus on professional practice in contrast to theoretical issues. Unlike a doctoral dissertation, there is no committee; there is only one faculty advisor. RPII is an actual study including statistical analyses or qualitative analysis and culminates in a document that includes:

- a 150-250 word abstract
- a review of the pertinent literature,
- a methods section including discussion of participants, procedure, materials and design
- a results section including tables and figures that are presented immediately after the text describing the tables and figures (this requirement differs from information in the APA Style Manual)
- a discussion section that reviews and discusses the findings, with reference to prior research findings;
- students should include sections on limitations and suggestions for future research
- a reference section that includes a DOI for each citation
- appendices

All components of the study are supervised by your faculty advisor and requires the faculty advisor's approval.

RPII must have the appropriate cover sheet (see attachment) and be of a scope appropriate to doctoral research. Three copies are submitted to the student's research advisor, who will distribute the copies to outside readers in preparation for the oral examination.

Upon completion of the oral examination and any required revisions the student is to submit two copies of RPII (including RPI as an Appendix) on two CDs or flashdrives to the Psychology Office. The student should also provide one electronic copy to their research advisor and another to the Program Director.

**Publication Credit.** Publication credit for Doctoral Research projects differs from Doctoral Dissertation standards. Faculty will tend to be first authors of publications due to the greater role that they take in the development of the idea, analysis, editing, etc.

## Faculty Research Interests

### Dr. Jordan Bate

Dr. Bate joined the faculty in September 2018

The Attachment & Psychotherapy Process lab applies attachment theory and research to the study of psychotherapy process in psychodynamically oriented child and family psychotherapies. Treatments studied include those aimed at preventing child maltreatment, promoting secure relationships for children in foster care, and supporting perinatal women and their families. Research questions focus on what makes psychotherapy interventions effective and how to train clinical psychologists in work with children, parents, and families. The lab studies risk factors for and the effects of relational trauma, factors impacting engagement and selection of a treatment modality, the development of the therapeutic relationship, particularly how clinicians effect change in child and family treatment, and the effectiveness of clinical training and supervision.

### Dr. Greta Doctoroff

My research focuses on two areas of early childhood research. The overarching goal of my research program is to identify key mechanisms to support young children's development and to foster caregiver-child and caregiver-parent relationships that can improve developmental outcomes, and to contribute to the evidence-base for cost-effective, feasible, sustainable prevention programs to support development (e.g., in Head Start, in the NICU).

First, my work aims to increase understanding of how to best support young children's (ages 2-5) social-emotional, behavioral, and early academic competence in preschool contexts. Most of my work has focused on children and families at-risk for negative outcomes due to poverty and its associated risk factors. I have a particular interest in parenting, teacher-child relations, and the development and maintenance of externalizing problems. My studies have included a focus on assessment in early childhood, using observational methods to understand parent-child and teacher-child interactions and examining the efficacy and effectiveness of preschool-based prevention programs.

Second, I have a more recent line of research examining how to best support developmental care and family-centered care in the Neonatal Intensive Care Unit (NICU) for babies born prematurely or critically ill. We have partnered with a NICU in the Bronx to do studies to learn about parent and staff experiences in the NICU with family-centered care.

### **Dr. Abraham Givner**

My interests are mostly related to graduate training issues. I have sponsored student research on most of these topics:

I am interested in an archival study that will analyze four years of data on the development of the New York New Jersey Externship Guidelines. The sample consists of approximately 2000 graduate students, 400 externship sites and 28 doctoral programs.

I am also interested in:

Student and faculty attitudes towards cheating and plagiarism in graduate school and its consequences;

Conflict between religious dogma and “best practices” in psychology.

The Conscience Clause and its effect on graduate education

Accommodations in graduate schools

### **Dr. Erum Nadeem**

The Community-Partnered Research to Improve Services and Practice (CRISP) research lab at Ferkauf Graduate School of Psychology conducts research that aims to improve the mental health and educational outcomes for children and adolescents from traditionally underserved populations. Our goals are to reduce disparities in mental health and educational outcomes and in access to services, and to improve the quality of services provided in schools and community settings. This is accomplished through studies of strategies to support implementation and sustainment of effective practices. We also have particular interest in observational and intervention-focused research aimed at understanding and serving the needs of youth exposed to trauma, community violence, and chronic stress.

#### **Ongoing projects:**

1. *Mental Health Service Needs and Patterns of Use among Urban Minority Children and Families.* In partnership with Dr. Sandra Pimentel and the Child and Adolescent Outpatient Clinic at Montefiore, I will be conducting a study of the primary needs, co-occurring mental and physical health, and ongoing service used of families served by the clinic. The project is still taking shape, but will likely use existing clinic data. There is a particular interest in documenting and improving services for children and adolescents with anxiety and trauma symptoms, and understanding the role of co-occurring chronic health issues. Students may be involved actively in data collection efforts for this project.

2. *Integrated Behavioral Healthcare in School Based Health Centers.* This study represents an ongoing collaboration between our team and the Montefiore School Based Health Centers. Specifically, we are examining the implementation of mental health screenings in school based health centers in the Bronx, and identifying facilitators and barriers to implementation.
3. *Using Continuous Improvement Methods to Support Teachers in Urban Classrooms.* The study involved piloting a teacher training and consultation model for teachers and school social workers to support the use of universal and targeted classroom approaches to enhance classroom climate and culture for students with trauma exposure and behavioral problems. The model includes a modular approach to implementing classroom practices known to impact student behavioral and emotional outcomes and a set of continuous quality improvement tools (e.g., a Classroom Practices Dashboard). The study also includes the assessment of compassion fatigue and vicarious trauma among educators, teacher aides, and school mental health staff. Data collection for this study is completed.

### **Dr. Tracy Prout**

Regulation Focused Psychotherapy for Children (RFP-C; Hoffman, Rice, & Prout, 2016) is a novel, manualized, time-limited psychodynamic treatment approach for children who manifest disruptive behaviors and emotional dysregulation. RFP-C conceptualizes children's externalizing behaviors as expressions of maladaptive defenses or impaired emotion regulation (ER). This 16-session psychotherapy method (plus four sessions with parents) operationalizes individual therapy approaches (play plus interaction) for children with externalizing behaviors, including ODD and the new DSM-5 diagnostic category of disruptive mood dysregulation disorder (DMDD).

We completed a pilot study in August 2016 and we are currently running 40 subjects in a grant-funded RCT of our treatment. We will be running a series of parent groups in June and are working on development of and funding for a school-based intervention.

Hoffman, L., Rice, T. R., with Prout, T. A. (2016). *Manual of regulation-focused psychotherapy for children (RFP-C) with externalizing behaviors: A psychodynamic approach.* New York, NY: Routledge.

### **Dr. Casey Shannon**

My research interests are primarily related to prevention and intervention among populations placed at-risk, with attention to related ecological and multicultural factors. I am particularly interested in educational equity and working with traditionally underserved populations. Current research projects are focused on academic achievement in juvenile corrections, opioid abuse and overdose, and multicultural issues and advocacy. I seek to integrate research with teaching strategies and intervention

approaches, and contribute to social change where possible, therefore I see myself as an applied researcher. I am interested in employing applied research methods such as participatory action research, Photovoice, and implementation science. I am also interested in qualitative research approaches, and opportunities to increase voice among marginalized populations. Research in my lab is collectively focused on social justice issues.

### **Dr. Esther Stavrou**

Intellectual and academic assessment. Specific issues might include assessment of English Language Learners, test validation, utility of various measures with specific populations, etc. Many of the cognitive tests used in the field have recently been revised (e.g. CAS2, UNIT2, WISC-V) and thus have generated numerous research opportunities. In addition, many tests are now being administered and/or scored electronically raising numerous practical and ethical considerations that need further investigation.

Assessment of attention and executive skills. The BASC-3 (a behavior rating scale) has recently been published with a new scale that measures executive functions). A comparison of this scale with other more established measures of executive functions would be a worthwhile project.

Assessment of gifted students. As part of an ongoing project, my students have been working with a specific district seeking to improve their gifted screening procedure. A specific goal is to better identify gifted students from minority backgrounds.

As a trainer, one area of research that I feel would be helpful is research on report writing (e.g. what type of information is more useful to parents and teachers, what format (bullets or narrative), how much jargon, impact of inclusion of test scores, etc.)

The impact of chronic illness on the academic and social functioning of children

### **Dr. Melanie Wadkins**

The Ferkauf Anxiety Research Laboratory (FAR Lab) aims to conduct research that contributes to a better understanding of anxiety and related disorders, specifically OCD. Projects are focused on improving the quality of life of children, families, and adults affected by anxiety disorders through identifying relevant aspects of living with anxiety that, if targeted, may help to improve evidence-based treatment.

Weekly lab meetings and outside lab work are required.

### **Ongoing Projects :**

1. *Examination of how Trust/Mistrust in God, religious coping, and intolerance of uncertainty relate to OCD symptoms and Scrupulosity.* Pilot research conducted with Orthodox Jewish undergraduates has yielded promising findings. The results of our prior study indicated that Trust in God and positive religious coping are significantly negatively related to OCD symptoms, scrupulosity, and intolerance

of uncertainty, while mistrust in God and negative religious coping are positively related to these variables. Furthermore, Trust in God emerged as a significant negative predictor of OCD symptoms above and beyond intolerance of uncertainty. Surprisingly, positive religious coping emerged as a significant positive predictor of scrupulosity above and beyond intolerance of uncertainty. These findings suggest that Trust in God is a protective factor for Orthodox Jews experiencing OCD, and treatment for OCD in this population should address these constructs. We will continue to explore these constructs in a sample of adults in the upcoming year.

2. *Examination of the basic emotion of disgust and its relationship to the maintenance and development of psychopathology, including OCD, anxiety disorders, and depression.* Disgust is an understudied emotion which is often times neglected in treatment, despite emerging evidence of its relevance in the development and maintenance of anxiety disorders. We recently collected data from a large sample of adults in the United States via Amazon Mechanical Turk, an online labor market, to investigate the link between various types of disgust, various OCD symptoms, and anxiety and depression symptoms. We will continue to analyze this data and plan the next stages of research in the upcoming year.

### **Writing Tips: Grammar and Punctuation**

All written material must conform to the rules in the *Publication Manual of the American Psychological Association, Sixth Edition*, **unless otherwise specifically specified in this document**. All written material must be written in formal professional format.

The following information about **verb tense** was downloaded from:

<http://agecon2.tamu.edu/people/faculty/leatham-david/Research%20Verb%20Tense.pdf>  
on August 25, 2012

**Consistency of Verb Tense** helps ensure smooth expression in your writing. The practice of the discipline for which you write typically determines which verb tenses to use in various parts of a scientific document. In general, however, the following guidelines may help you know when to use past and present tense. If you have questions about tense or other writing concerns specific to your discipline, check with your adviser.

#### **Use Past tense. . .**

##### **To describe your methodology and report your results.**

At the time you are writing your report, thesis, dissertation or article, you have already completed your study, so you should use past tense in your methodology section to record what you did, and in your results section to report what you found.

We hypothesized that adults would remember more items than children.

We extracted tannins from the leaves by bringing them to a boil in 50% methanol.

In experiment 2, response varied.

##### **When referring to the work of previous researchers.**

When citing previous research in your article, use past tense. Whatever a previous researcher said, did or wrote happened at some specific, definite time in the past and is not still being done. Results that were relevant only in the past or to a particular study and have not yet been generally accepted as fact also should be expressed in past tense:

Smith (2008) reported that adult respondents in his study remembered 30 percent more than children. (Smith's study was completed in the past and his finding was specific to that particular study.)

Previous research showed that children confuse the source of their memories more often than adults (Lindsey et al., 1991). (The research was conducted in the past, but the finding is now a widely accepted fact.)

**To describe a fact, law or finding that is no longer considered valid and relevant.**

Nineteenth-century physicians held that women got migraines because they were "the weaker sex," but current research shows that the causes of migraine are unrelated to gender. (Note the shift here from past tense [discredited belief] to present [current belief].)

**Use Present Tense. . .**

**To express findings that continue to be true.**

Use present tense to express general truths or facts or conclusions supported by research results that are unlikely to change – in other words, something that is believed to be always true:

Genetic information is encoded in the sequence of nucleotides on DNA.

Galileo asserted that the earth revolves the sun. (The asserting took place in the past, but the earth is still revolving around the sun. Note also that no source citation is needed here since it is a widely known and well-accepted fact that Galileo made this assertion.)

Sexual dimorphism in body size is common among butterflies (Singer1982).(Note how this statement differs from one in which you refer to the researcher's work in the sentence: "Singer(1982) stated that sexual dimorphism in body size is common among butterflies." Here you use past tense to indicate what Singer reported, but present tense to indicate a research result that is unlikely to change.)

We chose Vietnam for this study because it has a long coastline. (Use past tense to indicate what you did [chose Vietnam], but present tense to indicate you assume that the length of Vietnam's coastline is unlikely to change.)

**To refer to the article, thesis or dissertation itself.** Use the present tense in reference to the thesis or dissertation itself and what it contains, shows, etc. For example:

Table 3 shows that the main cause of weight increase was nutritional value of the feed. (Table 3 will always show this; it is now a fact that is unlikely to change, and will be true whenever anyone reads this sentence, so use present tense.)

**To discuss your findings and present your conclusions.** Also use present tense to discuss your results and their implications.

Weight increased as the nutritional value of feed increased. These results suggest that feeds higher in nutritional value contribute to greater weight gain in livestock. (Use past tense to indicate what you found [weight increased], but use present tense to suggest what the result implies.)

The following information on **conjunctive adverbs** was downloaded from <http://www.csulb.edu/colleges/cla/departments/english/wrl/handouts/conjunctive-adverbs/> On August 25, 2012

## Conjunctive Adverbs

### Overview.

Transitional expressions help your writing flow smoothly. One type of transitional expression, the **conjunctive adverb**, also serves to connect independent clauses that are coordinate. In other words, conjunctive adverbs are used to link together two ideas with similar subjects and emphases while helping your writing to flow.

**Conjunctive adverbs** are usually placed between two independent clauses following a semicolon and followed by a comma. When conjunctive adverbs occur anywhere else in the sentence, they are usually separated from the rest of the sentence by commas. Occasionally, a conjunctive adverb will begin a sentence, in which case it will be followed by a comma.

Here is a list of conjunctive adverbs:

<b>To show addition or another fact</b>	<b>To show contrast or</b>	<b>To show time change an idea</b>	<b>To show result</b>
again	anyway	meanwhile	accordingly
also	however	next	consequently
besides	instead	then	hence
finally	nevertheless	now	henceforth
further	otherwise	thereafter	therefore
furthermore	contrarily	thus	
moreover	conversely	incidentally	
nonetheless		subsequently	
<b>To show a specific case</b>	<b>To show comparison</b>	<b>To strengthen a point</b>	<b>To return to your point after conceding</b>
namely	likewise	indeed	still
specifically	similarly		nevertheless
<b>To recognize a point off your main point</b>			
undoubtedly			
certainly			

The following information on **semi-colon, colon and dash** were downloaded from:

*<http://virtual.parkland.edu/walker102/punct.htm> on August 25, 2012*

### **Use a semi-colon:**

To link two main clauses (those that could stand alone as full sentences) when the second clause begins with: however indeed instead nonetheless otherwise still then therefore thus

The orders are due on Friday; therefore, we must ship by Tuesday.  
We can't meet tomorrow; instead, we're planning to meet next week.

To separate items in a series if they are long or contain commas:

The materials include plywood panels and roofing; cedar siding, trim pieces and accents; and oak beams and rafters.

The new officers are Bill Smith, president and chief executive; Joe Brown, secretary; Mary Carter, treasurer; and Jane Jackson, recorder.

To closely relate two complete sentences of equal importance:

He puts in long hours; it's not uncommon to see him here at midnight.  
Low memory usage is only one of the product's advantages; it also offers high speed.

### **Use a colon:**

To introduce statements that explain, repeat or summarize the preceding idea:

We can't pay because all our money is invested in our home: we own property but have no cash.

To introduce lists that are preceded by the written or implied "the following":

We reviewed his complaints: the low pay, the long hours and the scheduling problems.

We need the following materials: cedar siding and trim; plywood paneling; and oak beams and rafters.

BUT omit the colon if a standard verb is used to introduce the list:

The materials include cedar siding and trim, plywood paneling and oak beams and rafters.

The new officers are Joe Baker, president; Ann Jones, vice-president; and Tom Lee, secretary.

### **Use a dash:**

In place of a comma or semicolon to add emphasis or show a change in tone:

He told us -- and we believed him -- that he would never steal from us again.

Many employees -- especially those at headquarters -- want to move to the new office.

I soon learned why no one was swimming -- the water was 55 degrees.

In place of a comma or parentheses to set off and emphasize nonrestrictive elements (those that add information but don't change the essential meaning of the noun):

The materials we need -- plywood panels and cedar siding -- will be here tomorrow.

In place of a colon to add emphasis or informality:

We liked the home's floor plan - the L-shaped kitchen, the wide hallways, the location of the bedrooms.

Note: To type a dash, use space-hyphen-hyphen-space.

The following information on **quotation marks and apostrophes** was downloaded from

**<http://www.is.wayne.edu/mnissani/cr/punctuation.pdf>** on August 25, 2012

**Quotation marks** are used to show the beginning and end of a quotation or a title of a short work.

Quotation marks enclose the exact words of a person (direct quotation).

Example: Megan said, "Kurt has a red hat."

Do not use quotation marks around a paraphrase (using your own words to express the author's ideas) or a summary of the author's words.

Example: Megan said that Kurt's hat was red.

### **Quotation marks with other punctuation**

**Place periods and commas inside quotation marks.**

Example: Aida said, "Aaron has a blue shirt."

**Place semicolons and colons outside quotation marks.**

**Example:** He calls me his "teddy bear"; I'm not a bear.

**Place question marks or exclamation points inside the quotation marks if they punctuate the quotation only.**

Example: "Are we too late?" she asked.

**Place question marks or exclamation points outside the quotation marks if they punctuate the entire sentence.**

Example: Why did she say, "We are too late"?

**Apostrophes** are used to show possession or to indicate where a letter has been omitted to form a contraction.

To show possession, add an apostrophe and an -s to singular nouns or indefinite pronouns that end in one or body. Example: Susan's wrench, anyone's problem

Add only an apostrophe for plural possessive nouns ending in -s. Example: my parents' car, the musicians' instruments

Add an apostrophe and an -s for plural possessive nouns that do not end in -s. Example: the men's department, my children's toys

Add an apostrophe and an -s for singular possessive nouns that end in -s. Example: Chris's cookbook, the business's system

Do not use an apostrophe with possessive personal pronouns including yours, his, hers, its, ours, their, and whose.

Apostrophes are also used in contractions, two words which have been combined into one, to mark where the missing letter or letters would be.

I am= I'm	I have = I've
who is = who's	let us = let's
cannot = can't	he is, she is, it is = he's, she's, it's
you are = you're	they are = they're

**Avoid confusing it's with its. It's is a contraction for it is; its is a possessive pronoun.**

The following information on **dangling participles** was downloaded from <http://homeworktips.about.com/od/improvingyourgrammar/a/What-Is-A-Dangling-Participle.htm> and [http://en.wikipedia.org/wiki/Dangling\\_modifier](http://en.wikipedia.org/wiki/Dangling_modifier) on August 25, 2012

### **Dangling Participles**

A participle is created when we turn a verb like eat or look into a word phrase that acts like an adjective. We create the participle by adding ing. A present participle is also called a gerund.

Look becomes looking; Eat becomes eating; Run becomes running

An adjective must modify some noun.

A participle at the head of a sentence automatically affixes itself to the subject of the following verb – in effect a requirement that the writer either make his [grammatical] subject consistent with the participle or discard the participle for some other construction."

Strunk and White describe as "ludicrous" another of their examples: "Being in a dilapidated condition, I was able to buy the house very cheap."

Bernstein offers another ludicrous example: "Roaring down the track at seventy miles an hour, the stalled car was smashed by the train."

"[6] Strunk and White put it this way: "A participial phrase at the beginning of a sentence must refer to the grammatical subject." [7]

Eating like a hungry hippo, the pancakes disappeared from my plate within seconds.

### Active and passive voice

The following information on **active and passive voice** was downloaded from <http://grammar.ccc.commnet.edu/grammar/passive.htm>

Verbs are also said to be either *active* (The executive committee approved the new policy) or *passive* (The new policy was approved by the executive committee) in voice. In the active voice, the subject and verb relationship is straightforward: the subject is a do-er or a be-er and the verb moves the sentence along. In the **passive voice**, the subject of the sentence is neither a do-er or a be-er, but is acted upon by some other agent or by something unnamed (The new policy was approved). Computerized grammar checkers can pick out a passive voice construction from miles away and ask you to revise it to a more active construction. There is nothing inherently wrong with the passive voice, but if you can say the same thing in the active mode, do so (see exceptions below). Your text will have more pizzazz as a result, since passive verb constructions tend to lie about in their pajamas and avoid actual work.

The passive voice is especially helpful (and even regarded as mandatory) in scientific or technical writing or lab reports, where the actor is not really important but the process or principle being described is of ultimate importance. Instead of writing "I poured 20 cc of acid into the beaker," we would write "Twenty cc of acid is/was poured into the beaker."

#### (Examples:

**The accelerator was pressed by her vs. She pressed on the accelerator**

The final exam was failed by ½ of the students vs. ½ of students failed the exam

The research will be presented by Dr. Givner at the conference vs. Dr. Givner will present the research at the conference)

“First person” style is not used at any point in RPI or in the methods section of RP II unless the instructions to subjects includes a first person script.

#### Passive Verb Formation

The passive forms of a verb are created by combining a form of the "to be verb" with the past participle of the main verb. Other helping verbs are also sometimes present: "The measure could have been killed in committee." The passive can be used, also, in various tenses. Let's take a look at the passive forms of "design."

Tense	Subject	Auxiliary		Past Participle
		Singular	Plural	
Present	The car/cars	is	are	designed.

<b>Present perfect</b>	The car/cars	has been	have been	designed.
<b>Past</b>	The car/cars	was	were	designed.
<b>Past perfect</b>	The car/cars	had been	had been	designed.
<b>Future</b>	The car/cars	will be	will be	designed.
<b>Future perfect</b>	The car/cars	will have been	will have been	designed.
<b>Present progressive</b>	The car/cars	is being	are being	designed.
<b>Past progressive</b>	The car/cars	was being	were being	designed.

“First person” style is not used at any point in RPI or in the methods section of RP II unless the instructions to subjects includes a first person script or in qualitative research.

## Headings

Headings can also function as an outline to reveal the paper's organization. This is particularly true when the paper is submitted to APA journals. Also, avoid having one sub-section heading in a paper. Use at least two subsections with any given section or none at all.

APA's heading style consists of five possible levels of subordination. Level 1 is the highest level and Level 5 is the lowest level. Most papers will use two or three levels. Levels are always used consecutively, beginning with Level 1.

1. Level 1: Centered, Boldface, Uppercase and Lowercase Headings
2. Level 2: Left-aligned, Boldface, Uppercase and Lowercase Heading
3. Level 3: Indented, boldface, lowercase heading with period.
4. Level 4: *Indented, boldface, italicized, lowercase heading with period.*
5. Level 5: *Indented, italicized, lowercase heading with period*

The following information on conjunctive adverbs was downloaded from

<http://www.csulb.edu/colleges/cla/departments/english/wrl/handouts/conjunctive-adverbs/>

On August 25, 2012

### Reporting Statistics in APA Style

**Dr. Jeffrey Kahn, Illinois State University**

The following examples illustrate how to report statistics in the text of a research report. You will note that significance levels in journal articles--especially in tables--are often reported as either " $p > .05$ ," " $p < .05$ ," " $p < .01$ ," or " $p < .001$ ." APA style dictates reporting the exact  $p$  value within the text of a manuscript (unless the  $p$  value is less than .001).

Please pay attention to issues of italics and spacing. APA style is very precise about these. Also, with the exception of some  $p$  values, most statistics should be rounded to two decimal places.

**Mean and Standard Deviation** are most clearly presented in parentheses:

The sample as a whole was relatively young ( $M = 19.22$ ,  $SD = 3.45$ ).

The average age of students was 19.22 years ( $SD = 3.45$ ).

**Percentages** are also most clearly displayed in parentheses with no decimal places:

Nearly half (49%) of the sample was married.

**Chi-Square** statistics are reported with degrees of freedom and sample size in parentheses, the Pearson chi-square value (rounded to two decimal places), and the significance level:

The percentage of participants that were married did not differ by gender,  $\chi^2(1, N = 90) = 0.89$ ,  $p = .35$ .

**T Tests** are reported like chi-squares, but only the degrees of freedom are in parentheses. Following that, report the  $t$  statistic (rounded to two decimal places) and the significance level.

There was a significant effect for gender,  $t(54) = 5.43, p < .001$ , with men receiving higher scores than women.

**ANOVAs** (both one-way and two-way) are reported like the  $t$  test, but there are two degrees-of-freedom numbers to report. First report the between-groups degrees of freedom, then report the within-groups degrees of freedom (separated by a comma). After that report the  $F$  statistic (rounded off to two decimal places) and the significance level.

There was a significant main effect for treatment,  $F(1, 145) = 5.43, p = .02$ , and a significant interaction,  $F(2, 145) = 3.24, p = .04$

**Correlations** are reported with the degrees of freedom (which is  $N-2$ ) in parentheses and the significance level:

The two variables were strongly correlated,  $r(55) = .49, p < .01$ .

**Regression** results are often best presented in a table. APA doesn't say much about how to report regression results in the text, but if you would like to report the regression in the text of your Results section, you should at least present the unstandardized or standardized slope (beta), whichever is more interpretable given the data, along with the  $t$ -test and the corresponding significance level. (Degrees of freedom for the  $t$ -test is  $N-k-1$  where  $k$  equals the number of predictor variables.) It is also customary to report the percentage of variance explained along with the corresponding  $F$  test.

Social support significantly predicted depression scores,  $\beta = -.34, t(225) = 6.53, p < .001$ . Social support also explained a significant proportion of variance in depression scores,  $R^2 = .12, F(1, 225) = 42.64, p < .001$ .

**Tables** are useful if you find that a paragraph has almost as many numbers as words. If you do use a table, do not also report the same information in the text. It's either one or the other.

Based on:

American Psychological Association. (2010). *Publication manual of the American Psychological Association* (6th ed.). Washington, DC: Author.

## References

Follow all APA rules for print references as delineated in the Sixth Edition of *Publication Manual of the American Psychological Association*

## Electronic References

APA has published an *APA Style Guide to Electronic References* as a PDF. Please follow these guidelines for all electronic reference

## Format and Writing Style

The research papers (RPI and RPII) should adhere to the style recommended in the APA Publication Manual (Sixth Edition, 2009) unless otherwise specified in this document.

RP II will include in the following sequence of pages:

- Abstract
- Title Page
- Acknowledgement
- Table of Contents
- List of Tables
- List of Charts
- List of Figures
- List of Appendixes
- The Research Paper itself
- References

## Appendixes

**Format for Abstract (150-250 words)**

## ABSTRACT

The Complete Title of Research Project II

by

The Name of the Student

The word ABSTRACT is 1” FROM THE TOP OF THE PAGE.

Remember that the Abstract must have a maximum of 250 words not counting the word, Abstract, the Title of the Research Project, the word by, and the Student’s Name. The first page of the abstract is not numbered. If there is a second page to the abstract, the page number should be reflected in the upper right hand corner of the page using an Arabic number 2 without any dashes or use of a period.

**Title page** – see attachment for a template of Title Page

**Format for Acknowledgements**

[2” from the top of the page]

**Acknowledgements**

This section is not required, but it offers an opportunity to express the writer’s appreciation to any person(s) who has/have been supportive in preparation of the research. It is an opportunity to thank all of the appropriate individuals who helped the student through this process.

**Oral Examination**

The oral examination for the Psy.D. degree occurs after your faculty advisor has approved Research Project II. **The advisor selects two readers to participate in the oral examination.** The student submits three copies of Research Project II to his/her research advisor or to the selected readers. Readers are selected from full-time or adjunct faculty or other professionals with expertise in the research area. In the latter case, the Reader must submit his/her c.v. to the Office of the Dean for approval. **The documents must be submitted at least two weeks prior to the exam.**

**The advisor notifies the secretaries in the Psychology Office of the readers and arranges for a time, date and place for the exam.** The advisor completes Form Psy.D. 03.

The oral examination is the final competency examination in the program. The purpose of the exam is for the student to demonstrate mastery of:

1. the literature in their selected research area
2. methodological issues
3. the study's results
4. implications of their findings for the field
5. relationship of science to practice.

### **The format for the Oral Examination**

As noted earlier in this document, the faculty members at the oral examination do not constitute a "committee." Rather, there is a faculty advisor and two readers.

1. The Examination lasts about 60 minutes.
2. The student will have approximately 15 minutes to make an oral presentation of her/his research. It is suggested that the student NOT read their presentation. You may have an outline, index cards or use a PowerPoint presentation to guide the discussion.
3. The 15 minute presentation should include:
  - a. the statement of the problem
  - b. review the most pertinent literature
  - c. review the methodology
  - d. review the most pertinent findings that are related to the hypotheses
  - e. review the discussion with focus on implications and limitations
4. After the student's presentation, the Readers and the Research Advisor are given an opportunity to examine the student on their research. The questions may focus on the literature, the methodology, the results and their interpretation. It is expected that the student will demonstrate a high level of competence in response to all the issues that are raised
5. After the question and answer period, the student is asked to leave the room so the Readers and the Research Advisor can evaluate the student's performance.
6. Several options are available:
  - a. The three examiners can either "Pass" or "Fail" the student on their Oral performance. Each person presents their view and a discussion ensues if there are issues that need clarification. If the Examiners unanimously determine that the student has Passed the Exam, they then move on to discuss the written document. If the unanimous decision is made that the student Failed the exam, a further discussion with Program Faculty will take place to determine the necessary remediation. A second examination will be scheduled after the student has successfully completed the remediation plan. Should the student fail the second examination, they will not be given an opportunity to take a third examination. At this point, the student will be dismissed from the program.
  - b. Assuming the student has passed the oral part of the examination, the readers and faculty advisor commence a discussion about the document itself. The document can be evaluated as needing:

“No Revisions” – in which case the document is accepted in its current form, though there may be a need for simple editing;

“Minor Revisions” – in which case the readers and/advisor require the student to rewrite sections of the paper to clarify issues that have arisen; or to redo analyses; or to add references and interpretations; or other matters (In this case, the document needs to be reviewed again by the Research Advisor);

“Major Revisions” – in which case it is determined that significant portions of the document need to be re-written (In this case the document needs to be reviewed again by both Readers and the Advisor).

- c. The three examiners complete all required forms for the Registrar and the Psychology Office.
7. The student returns to the room and receives the comments from the three examiners.
8. The student brings the required forms to the Registrar and Psych Office.
9. Upon completion of any revisions to the document, the Faculty Advisor will submit a grade for RPII - PSS or PSC6516 and submit Form to Registrar verifying that all suggested revisions have been completed. This form is included in the packet that the Research Advisor receives from the Registrar.
10. Upon successful completion of Research Project II and the oral examination, the student is required to submit two CDs or flashdrives) that include both RPI and RPII, to the Psychology office. In addition, the student usually submits one written signed document to the faculty research advisor and an electronic copy to the Program Director.
